What is Gum (Periodontal) Disease?

It's a painless gum infection caused by pathogenic bacteria living on the root surfaces of your teeth deep below the gum line. Most people have it and it's the major cause of tooth loss in adults.

The bacteria trig□ger an inflammation that, left untreated, gradually destroys the bone and supporting tissue that surround and support your teeth.

Am I the Only One?

Definitely not! Periodontal disease is, by far, the leading cause of adult tooth loss. While only 25% of adults have a cavity, 85% have a periodontal infection! Most have gingivitis, an infection that hasn't damaged the bone … yet, but almost 40% have periodontitis, an advanced infection that ultimately destroys the bone that supports the teeth.

Your Life May Be At Risk!

Treponema denticola (1,000X) One of 57 species of spirochetes that cause gum disease.

Periodontal disease affects the whole body. If you have periodontal disease, you're much more likely to have a heart attack or stroke.

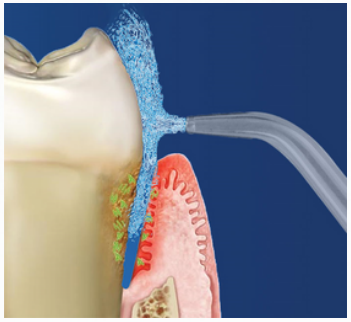

The same bacteria that cause periodontitis are also found in the plaques that block arteries. It also greatly increases the risk for major diseases like diabetes, cancer, pneumonia, and osteoporosis. Babies born of women with periodontitis typically have lower birth weights.

It's Contagious!

Like other infections, periodontal disease is contagious. It's spread mostly by kissing, but also by sharing anything that goes in the mouth like spoons and forks. How contagious is it? If a parent is infected, the odds that the children also infected go up by 50%. Ditto for their spouse. It can even be spread from pets to humans.

Why Use an Oral Irrigator? I Already Brush & Floss.

Tooth brushes and floss are great for cleaning the parts

of your teeth that you can see, but the bacteria that cause gum disease grow out of sight on the roots of your teeth beyond the reach of brushes and floss. Subgingival (below the gum line) root surfaces are difficult to clean.

Hygienists spend years in dental hygiene school learning how to use special instructions (scalers) to clean them.

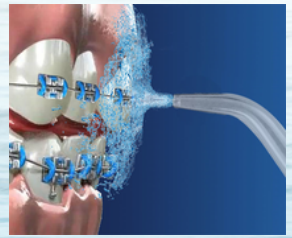

Mouthwashes aren't very effective at killing subgingival bacteria because swishing only penetrates 1/10 of a millimeter below the gum line.

That's why many dental professionals recommend irrigating the teeth and gums daily with a Viajet Oral Irrigator. It flushes bacteria and food particles from all the little subgingival nooks and crannies that brushes and floss just can't reach.

Even irrigating with plain water reduces the number of bacteria by half. Using an antimicrobial agent like TheraSol instead of water is even more effective. Viajet's powerful stream can reach up to 4 mm below the gum line with either the Standard or Sulcasoft tips. If you have periodontal pockets deeper than 4 mm, the optional Cannula Adaptor Kit (see other side) can deliver irrigants to the full depth of even the deepest periodontal pockets.

Braces

Orthodontists recommend ViaJet irrigators are easily the best and most efficient way to keep orthodontic braces and brackets sparkling clean. Nothing else even comes close.

New Features & Details

Infinitely Variable Power Dial with On/Off Push Button Memory setting.

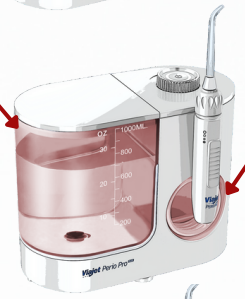

Four Stage Flow Control with Instant Off Feature for even finer control.

New Large Font, Easy-to-Read Measuring Lines in Both Oz. & Ml. Makes It Easy to Measure or Dilute Antimicrobial

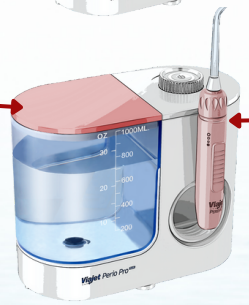

No More Stuck Tips.The New Quick-Release Collar Instantly Ejects & Attaches New Tips

A Removable, crystal-clear Reservoir Makes It Easy to Fill and See the Contents at a Glance

No More Messy Hoses! The Hose Automatically Retracts into Its Own, Easy to Clean Compartment

Large Removable Lid Makes Filling & Cleaning the Reservoir Quick & Easy

Handle Attaches Magnetically! Just Touch It Anywhere on the Front Side and it Stays in Place!

Internal Tip Storage Compartment

Now with Five Different Types of Tip for Every Part of Your Mouth

ViaJet Now Comes With Unique Tips for Every Part of Your Mouth

2-Jet Tips Blasts away food particles & reduces bacterial levels with a strong pulsed stream.

Perio Tip Soft pointed tip for irrigation periodontal pockets.

Plaque Tip Three soft mini-brushes help scrub away plaque while irrigating

Ortho Tip Shorter, stiffer bristles shaped for cleaning braces and brackets while irrigating.

Tongue Cleaner Prevent halitosis by scraping the paddle shaped tip along the tonge while irrigating. Shorter, stiffer bristles

Pocket Care - Handheld Deep Pocket Low Pressure Pocket Irrigator

The Pocket Care is a small (15cc) squeezable bottle with a 24 Ga. Cannula that's long enough to reach the bottom of even the deepest periodontal pockets. Ideal for irrigating a few deep pockets or to pack when traveling. Like a dental instrument, the tip is pre-bent at a 45° angle to make reaching the back teeth easy. Has a protective cap for storage.

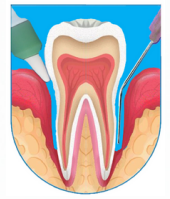

The counter-top Viajet irrigator with the Cannula Kit makes irrigating many deep pockets easier. Not for use with organic oils.

Cannula Adaptor ViaJet accessory for Low PressureDeep Pocket Irrigation

The Viajet's Standard & SulcaSoft tips can irrigate to a depth of 4 mm. Long and thin Cannula (cannula) tips like those in the picture, can deliver antimicrobial agents, like TheraSol, to the bottom of even the deepest periodontal pockets where the most harmful bacteria grow. The optional Cannula Adaptor Kit (sold separately) enables cannula to be attached to the standard Viajet handle.

The Cannula Kit comes with an adaptor and two styles of cannulae and usage instructions, but we recommend asking your dentist or dental hygienist to show you how they would like you to use it.

- Delivers irrigants to the bottom of even the deepest periodontal pockets where the most infectious bacteria grow and damage the bone.
- Inexpensive, compact design.
- Easy and intuitive to use.
- Compatible with all water-soluble antimicrobial agents like TheraSol.
- Saves money! Precision delivery of antimicrobial agents to the base of periodontal pockets eliminates waste.
- Low pressure stream doesn't harm tender gum tissue.

Includes two different tips:

- Side Port: Round end slides easily into pockets. An opening 1 mm from the tip vortexes the solution more efficiently.
- Single End Opening: Solution sprays from an opening at the very end of the tip.
